-----

This study offers an innovative perspective on the synergistic optimization of SES with DN and provides a practical methodology for low-carbon economic dispatch in power systems.

This paper, therefore, proposes a low-carbon planning method for distribution networks that comprehensively considers VES resources, renewable energy, and their ...

As the world transitions to decarbonized energy systems, emerging long-duration energy storage technologies will be critical for supporting the widescale deployment of ...

Under conditions ensuring reliable grid operation, a distribution network system equipped with energy storage and a tiered carbon pricing mechanism can achieve a 10.7% reduction in ...

These findings validate the model's ability to balance economic benefits and low-carbon operational goals, providing a practical and effective solution for the optimal scheduling ...

To address the aforementioned issues, this paper establishes a precise carbon emission model for energy storage in the distribution transformer area. It combines the ...

This paper proposes a low-carbon economic optimization scheduling model for the distribution network, considering an improved dynamic carbon emission factor to shift carbon ...

With the advancement of carbon peaking and carbon neutrality goals and the evolution of new power systems, the carbon market and energy storage systems have become essential ...

This study focuses on optimizing shared energy storage (SES) and distribution networks (DNs) using deep

reinforcement learning (DRL) techniques to enhance operation ...

To address the aforementioned issues, this paper establishes a precise carbon emission model for energy storage in the distribution transformer area. It combines the influence of carbon ...
