-----

To address these issues, this study develops an evolutionary game model involving renewable energy generation enterprises and energy storage companies. The model ...

To address these issues, this paper proposes a cooperative operation strategy for MMG and electric vehicle charging station (EVCS) considering the SES characteristics of ...

Based on the concept of sharing economy and considering the complementary characteristics of source and load resources between different virtual power plants, this paper ...

To address these challenges, this paper proposes a shared energy storage allocation strategy for renewable energy plant clusters, considering alliance cooperation costs ...

Therefore, this article proposes a study on the grid-connected optimal operation mode between renewable energy cluster and shared energy storage on the power supply side.

Initially, a cost-benefit model for shared energy storage operators, along with power generation users, demand-side consumers, and microgrid prosumers is developed.

The continuous charging phase of the shared energy storage power station is from 3:00-5:00 and from 8:00-9:00, and the charging power of the shared energy storage power station reaches ...

The subsequent sections of this paper will delve into the mathematical formulation of this model, the specific allocation ...

The model considers the maximum operating benefit of the SESS as the upper objective function and the

minimum operating cost of the MIES as the lower objective function.

The subsequent sections of this paper will delve into the mathematical formulation of this model, the specific allocation mechanisms derived from cooperative game theory, and a ...

In response to resource constraints, power organizations are increasingly adopting renewable energy solutions. However, the inherent volatility and intermittency of renewable ...
